

Your Only choice is Documentation

Emmanuel Ajoku

June 2025

1 Introduction

This is a side project I made of my own choice as a test to see how I could use certain data structures.

1.1 Note:

You'll see two files called "HustleNode" and "HustleList". These two files were the first iteration of the code using linked lists before being remade with different data structures

2 Core Classes

```
Public class move
String name
int frames;

public move(String name, int frames) {
this.name = name;
this.frames = frames;
}

public class Character
String move
List<move> moves;

public Character(String name) {
    this.name = name;
    this.moves = new ArrayList<>();
}
public void addMove(move move)
```

2.1 class move

class file that holds a String representing attack names and an int representing frames. Each instance being an attack.

2.2 class Character

Representing a character, has the name of the character and a list containing the move class, named moves.

3 HustleDataLoader

Contains a fight method that simulates combat. Combat method calls a combo method
